AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

- 1. (Currently Amended) Apparatus An apparatus for controlling the communication loads placed upon a human user by a computer system, the computer system comprising a plurality of information management systems, each of the information management systems being operable to assist and communicate with the human user, the apparatus comprising:
 - (i) receiving means for receiving <u>at least</u> one <u>or more inputs input</u> representative of <u>at least</u> one <u>or more tasks task of a first type</u> to be performed by the information management system and for receiving information <u>associated with resulting from</u> the performance of <u>the one or more tasks</u> of said at least one task of said first type from the information management system;
 - (ii) generating means for generating an executable <u>a</u> task <u>of second type</u> for communicating the received information to the human user;
 - (iii) scheduling means for;
 - a) receiving a user workload input representative of user workload identifying the user's current and future activities; and
 - b) scheduling an execution time for said executable at least one task
 of a second type for communicating the received information to the human
 user so as to avoid the user's current and future activities identified by the
 user workload input.

- 2. (Currently Amended) Apparatus An apparatus according to claim 1, wherein, when the input comprises a change to a previously received input, the scheduling means is operable to change the execution time associated with the previously received input, thereby rescheduling communication of the information associated with the previously received input.
- 3. (Currently Amended) Apparatus An apparatus according to claim 1, wherein the apparatus further includes a world model, which world model comprises at least one or more parameters parameter associated with the or each input, and is accessible to the scheduling means.
- 4. (Currently Amended) Apparatus An apparatus according to claim 3, wherein the parameters include at least one of a start time of the or each task, a deadline time of the or each task, a duration of the or each task and/or interruption status of the human user.
- 5. (Currently Amended) Apparatus An apparatus according to claim 4, wherein the an entity can explicitly specify the interruption status for allowing or otherwise not allowing interruptions to the human user.
- 6. (Currently Amended) Apparatus An apparatus according to claim 1, including means for storing human user preference information, which user preference information includes preferred actions of the human user relating to task information.
- 7. (Currently Amended) Apparatus An apparatus according to claim 3, wherein the world model is maintained by a diary, which diary is responsive to inputs from the execution means and schedules execution of the said task to occur in a free timeslot of the diary.

AZVINE et al Appl. No. 09/806,694 August 11, 2005

- 8. (Currently Amended) Apparatus An apparatus for assisting in the management of information flows for <u>a</u> human user according to claim 1 comprising further means operable to concurrently execute a plurality of processes.
- 9. (Currently Amended) Apparatus An apparatus according to claim 1, wherein the information management systems include at least one of a diary assistant, an email assistant, a telephone assistant and a web assistant.
- 10. (Currently Amended) Apparatus An apparatus according to claim 1, further comprising means responsive to an input signal indicative of a state of mind of <u>a</u> human user, wherein the scheduling means is further arranged to schedule an execution time for a task in dependence on the received input.
 - 11. canceled.
- 12. (Currently Amended) Apparatus An apparatus according to claim 1, wherein the receiving means (i) is further operable to receive the input indicative of an interruption status for the user.
 - 13-15. cancelled.
- 16. (Currently Amended) A <u>method embodied as a computer programs</u>, or a suite of computer programs, comprising a set of instructions, or a suite of a set of instructions, to cause a computer to perform the method according to claim 17.
- 17. (Currently Amended) A method of controlling the communication load placed upon a human user by a computer system, the computer system comprising a plurality of information management systems, each of the information management systems being operable to assist and communicate with the human user, the method comprising the steps of:

AZVINE et al Appl. No. 09/806,694 August 11, 2005

- (i) receiving <u>at least</u> one or more inputs <u>input</u> representative of <u>at least</u> one or more tasks task of a first type to be performed by the information management system;
- (ii) receiving information associated with resulting from the performance of the one or more tasks said at least one task of the first type from the information management system;
- (iii) generating an executable a task of a second type for communicating the received information to the human user;
- (iv) receiving a user workload input representative of user workload identifying the user's current and future activities; and
- (v) scheduling an execution time for said executable at least one task of a second type for communicating the received information to the human user so as to avoid the user's current and future activities identified by the user workload input.
- 18. (Currently Amended) A method according to claim 17 further including the step of enabling the information management systems to perform the new task of a second type at the scheduled execution time.
- 19. (Currently Amended) A method embodied as a digital data carrier containing computer accessible code for loading into a computer for the performance of claim 17.
